

# Wetronit Sealing Clay Pellet for Well Construction

## property feature of Wetronit

- **WETRONIT 51/10** is a sealing clay pellet swelling to a large extent with its typical special form. It contains a ferric oxide additive and thus can be located by magnetic log.
- **WETRONIT 50/10** is a sealing clay pellet swelling to a large extent with its typical special form. This geometry of pellets turned out to be very good because of its sinking properties.
- **WETRONIT 70/10** is a less swelling product to a reduced price. The reduced swelling property results in a smaller part of montmorillonite.
- **WETRONIT 100/10** is even less swelling because of a smaller percentage of montmorillonite than 70/10. It can only fill up space and should be used in case of sealings without any special requirements.
